Distress, often called the sixth vital sign, should be closely monitored in all patients from diagnosis to end of life. In more severe cases, patients may even experience symptoms of post-traumatic stress disorder that can impact their adherence to follow-up care. Learn about new tools for distress screening that will boost your ability to help your patients throughout the care continuum.

**Target Audience:** All Levels

**Level of Content:** Intermediate/Advanced

**Speaker:**
Linda Watson, RN, PhD, CON
Lead, Person-Centered Care Integration
Alberta Health Services
Calgary, AB, Canada

**Full Disclosure:**
Nothing to disclose

**Objectives:**
At the end of this session, participants will be able to:
1. Describe how oncology nursing care can be organized and enhanced through the use of routine screening for distress.
2. Identify how individuals could integrate Screening for Distress into practice settings or individuals’ own practices.
3. Explore the application of the Screening for Distress intervention by participating in several case studies revolving around clinical oncology scenarios and the utilization of Screening for Distress to organize the identification, assessment, and management of distress.
