Desktop on an OpenPOWER system? YES!

Dan Horák / sharkcz
Desktop on an OpenPOWER system? YES!

- Introduction
- Why?
- Hardware
- Firmware
- OS and User Software
- Challenges
Introduction

• /me works in the Multi-Arch team in Red Hat
• our goal is parity between all arches
Why?

- why not ;-)
- dog-fooding aka test what we produce
- working locally vs. remotely
- it’s high-performance and open
- heterogeneity helps quality
Hardware

- https://openpowerfoundation.org/
- complex relationship between PowerPC and POWER
- embedded vs. server
  - https://openpowerfoundation.org/?resource_lib=power-isa-version-3-0
- IBM with FSP vs. OpenPOWER with BMC
- from full-rack E980 to microATX Blackbird
- pseries and powernv
- hash and radix MMU, KVM - HV and PR, nested KVM
Hardware

- IBM Witherspoon (AC922)
- Winstro, Inspur, ...
- Supermicro Boston (P9DSU)
- Google/Rackspace/Ingrasys Zaius
- Yadro Vesnin – 8TB in 2U
- Raptor CS Talos II and Blackbird
Raptor Talos II

- further development of OpenPOWER reference design (Romulus)
- [https://www.raptorcs.com/TALOSII/](https://www.raptorcs.com/TALOSII/)
- dual-socket EATX/SSI-EEB with schematics on DVD
- proper fan control as main differentiator
- blob-free when without the SAS controller
- NIC firmware being reverse-engineered and re-implemented as open-source
- 1st Power/PowerPC workstation after ~10 years
Firmware

- 2 computers on one board
- BMC - https://github.com/openbmc or proprietary
- host - https://github.com/open-power or vendor’s git (eg. https://git.raptorcs.com/git/)
  - SBE
  - hostboot
  - skiboot – implements OPAL runtime services
  - skiroot with petitboot (kexec bootloader)
  - every instruction on CPU comes from open-source
Software

- Linux and FreeBSD, other in development
- ppc64 and ppc64le
- glibc and musl
- ELFv1 and ELFv2 ABI
Fedora

- only ppc64le since F-29
- Everything, Server, Cloud
- desktops installable from Everything
- installation possible from USB in F-30 without workarounds
  - https://copr.fedorainfracloud.org/coprs/sharkcz/talos/
- RPMFusion is available
Challenges - hardware

- new keyboard ;-)
- updating FPGA for early adopters
- damage on the bottom of the mainboard
- not all consumer cards work – visit HCL
Challenges - software

- convince upstreams there is new and powerful HW
- unresponsive upstreams
- 64KB vs 4KB kernel page size
- different firmware versions between skiroot and host
- DMA for 3D graphics
- browsers
  - FF works out of the box, JIT for JS in development
  - Chromium ported, so QT WebEngine possible
Challenges - software

- QEMU – powernv model
- multimedia codecs optimizations
- conflicting types for SIMD/Altivec – c++ vs gnu++
- faster boot
  - https://opensource.com/article/19/1/booting-linux-faster
- “CI as a service” is missing
- powernv in anaconda
Conclusion

- Yes, it works! It’s my primary workstation
- some demo
My Talos

- 2x 8-core (unpaired) P9
- 4x16G RAM
- PMC/Adaptec SAS
- Marvell SATA
- AMD Radeon Pro WX4100
- SoundBlaster Audigy FX
- Fedora 28 with XFCE
