Jetstream is a user-friendly cloud computing environment. It's designed to deliver the services and programming needed by researchers in the long-tail of science.

As one of Jetstream's initial science gateways, Galaxy offers two options:

- Galaxy Main automatically runs jobs for genomics researchers using compatible virtual machines (VMs) created on-demand

  - Private Galaxy VMs can be launched to create customized analyses and workflows

    -- Self-serve standalone images preserve custom workflows with a DOI.
