Abstract text: With the passage of MAP-21 (Moving Ahead for Progress in the 21st Century Act) and the subsequent requirements for every state DOT to provide ARNOLD (All Road Network of Linear Referenced Data) it has become increasingly clear that Arizona needed to consider combining resources across jurisdictions and agencies to meet these new challenges. This presentation will talk about how the Arizona Department of Transportation is partnering with other state agencies and local agencies to promote and develop data supply chains. As with industry where companies rely on various suppliers of components, the State DOT is relying on external data owners for components of the statewide dataset. Arizona DOT effort and focus has been on pulling the various datasets together, unifying them, and transforming the network into a Linear Referencing System for the whole state. In turn, Arizona DOT provides the network to be used by the whole state with the value added of unifying the States E911 data in the process.

Note: Additional State DOT participation in this session forthcoming
