CHAPTER 5

LAW STUDENT LEARNING, STORYTELLING, AND STUDENT DEVICE INITIATIVES

MICHAEL BLISSENDEN

Abstract

Law student learning today needs to be student centred and involve active learning. Students need to engage with how the law in society develops over time and how the law is made up of stories and storytelling. At the same time modern day students are accustomed to using technology in their lives. This has resulted in a move in higher education to tap into technology as part of engaging students with their active learning. This paper focusses on a policy by an Australian university of providing students with mobile devices for their learning in law and how the initiative can actually be interwoven with teaching pedagogy used in the classroom.

Keywords: active learning, iPad, law, pedagogy, storytelling

---

1 Michael Blissenden
Associate Professor of Law
Western Sydney University, Sydney
Judicial reasoning is thus an art, overwhelmingly discharged in printed words and sentences. It is an art that calls on skills of narration and storytelling. The stories are normally told in words alone. Sometimes words are accompanied by pictures, drawings or maps to make things clearer. Nowadays, judicial narrative appears in electronic form shortly after delivery of judgment, available on the court’s webpage. (Kirby, 2000, p. 4)

Many modern academics have urged the use of storytelling as a means of giving voice within the legal discourse to the outsider. They argue that the law is indeed replete with stories. (Heerey, 2000, p. 683)

In the classroom environment, there are a number of ways the pedagogical basis of storytelling can be utilized. Professors can tell “war stories”, thereby providing students insight into how the law functions. (Blissenden, 2015, p. 214)

A more student-centred application of the storytelling methodology relates to the stories behind reported cases. The goal of this approach is to stimulate student interest in how the litigated case came before the courts. (Blissenden, 2007, p. 264)

Modern technology has taken the act of storytelling to new heights, resulting in a range of opportunities and tools for creating, learning, teaching, and sharing knowledge in engaging ways and through innovative formats. (Lal, Donnelly, & Shin, 2015, p 54)

iPads were found to be a good tool to provide instant access to rich learning materials and to Internet resources… In addition, students often used iPads for information seeking….Students found an iPad to be a useful tool to increase flexibility, portability and productivity because it is small in size, easy to use and apps could be loaded. (Nguyen, Barton, & Nguyen, 2014, pp. 6-7)

**Introduction**

The above quotes illustrate the recent development of ideas concerning how the law can be viewed from a story point of view. The literature indicates that judicial decision making can be viewed as a means of storytelling, law professors can retell their experiences through war stories and students can engage with the stories told by clients in the litigated case. Storytelling makes the law alive, makes learning the law more interesting and makes the law more accessible through human emotions.

At the same time there have been dramatic advances in technology that the current generation of students have been exposed to and have become
accustomed to using in their daily lives. This has also been translated to the teaching and learning environment within higher education. Technological advances such as laptops and iPads have been utilised within and outside the classroom to actively engage students.

A key question that has not been dealt with in the literature is the interplay between the emerging pedagogy of storytelling and the use of student devices to further facilitate the learning experiences of law students. This paper will examine an initiative at Western Sydney University (previously UWS) where all enrolling first year students, including law students, were provided with an iPad in 2013 and how these were used in a classroom environment, including applying the storytelling pedagogy, and compare that experience with second and third year law students, who did not receive an iPad, but generally used laptops.

**Student Learning and Storytelling**

It is generally accepted that student learning needs to be student-centred and involve active learning within and outside the classroom. This applies to law students in higher education. Gone are the days of mere information transfer by the teacher, and there needs to be an appreciation of active student involvement with their learning with the flipped classroom concept being a recent approach.

In that regard there is little doubt in relation to law students that storytelling is an integral element of the law and being a lawyer. From the moment a client enters the office and recounts the basis of their particular situation to the lawyer, the makings of a story has emerged. The version of events, as described by the client, provides one side of the facts. The other story, told by the other side will provide a different side of those facts. The end result may be that the legal matter goes to court, resulting in a judge constructing a story in the form of a judgment (Kirby, 2000).

It is only more recently that the concepts of narrative and storytelling have been recognised as legal scholarship (Krieger & Martinez, 2010). It is becoming more common within law school classrooms for the pedagogy of storytelling to be utilised as a teaching and learning mechanism (Moran, 2015). One particular aspect of the storytelling method that links in with the well-known legal teaching of the case method is to have students investigate the background to the litigated case and understand the human dimensions of the factual background (Blissenden, 2007). This approach not only applies the storytelling methodology to the learning and teaching of law but also enables students to be actively involved in their learning. In
this way the storytelling methodology facilitates a student-centred learning environment.

**Student Use of Technology**

The dramatic changes in technology in recent years have provided immense opportunities for learning, with higher education students reporting an increase in mobile technology from 1.2% in 2005 to 62.7% in 2010 (Rossing, Miller, Cecil, & Stamper, 2012, p. 1). Technology is a large part of daily life and bringing such technology into the classroom may be seen as a natural progression and not overly difficult for students (Wardley & Mang, 2015, pp. 5-6). Students are comfortable with technology and have been exposed extensively with a wide array of wireless machines, including iPhones, iPads, and other tablets. This does not always mean though that this translates to a better learning environment. Technology provides for mobile learning and for students to engage in the educational space at anytime and anywhere. Students also expect to be able to work and learn whenever they want (Rossing et al., 2012, p. 3). There needs to be a connection between technology, the expectation of being able to access educational material at a convenient time and being able to link the educational material to a sound pedagogical learning environment. The two do not automatically link together. There needs to be a well thought out approach to how to ensure the educational material can be formulated so that it enhances a student’s ability to learn and apply the educational material.

This applies to all disciplines, not only with regard to the study of law.

**Introducing iPads into Higher Education Classrooms**

Western Sydney University distributed 11,000 iPads to every new student and all academic staff in 2013 to support learning and teaching innovations across the curriculum and in informal learning environments. As part of this announcement, the University released the following:

"With digital technology revolutionising how we connect and interact with the world, university study should be no different," said Professor Kerri-Lee Krause, UWS Pro Vice-Chancellor (Education).

"This initiative will not only readily equip our students and academic staff with mobile tools to enhance learning, it will also help them to engage with an ever-increasing online world."

---

2 As announced on the Western Sydney Website: http://www.uws.edu.au/
Law Student Learning and Storytelling

Professor Krause says the iPad initiative is just one part of a comprehensive curriculum renewal strategy at UWS, which includes implementing more flexible study options for students and a blended learning model for all UWS degrees from 2013 and beyond.

Mobile technologies will be a key part of this strategy. We want to support our academic staff to make the most of iPads and custom-designed apps in class so that, even in the largest lecture theatre, students have access to just-for-me, just-in-time interactive learning experiences.

Professor Krause says the iPad initiative is part of a suite of innovations that involve emerging technologies to engage students within and beyond the traditional classroom, as well as making the most of work-based and community-based learning to bring higher education to life.

Our students tell us they want more flexible ways to learn. They have paid work and family commitments, yet they value the support offered by a campus-based experience. To increase flexible access to 'learning on the go', our students will be able to learn using more online and web-streamed material while at the same time benefiting from 'flipped' approaches to traditional university teaching that emphasise interactive and collaborative face-to-face learning.

We are also expanding the range of study modes, to include more intensive and weekend classes to give our students more flexibility and choice.

The iPad initiative is just one part of our broader, four-year Blended Learning Strategy to embrace emerging technologies and other modes of learning as a way to complement our face-to-face teaching, which will of course remain core to UWS.

With six campuses geographically spread across the expansive region of Greater Western Sydney—each offering free wireless internet to students—the UWS iPad initiative also ensures that all new students can connect with the University via Wi-Fi at any time of day.

"The University's analytics also show that our e-learning system is accessed 24 hours a day, seven days a week," says Professor Krause.

So, not only do we expect this initiative to be useful for students on campus as part of their university studies, but we expect it will also greatly enable our first-year students to engage with the University and their learning when and where they choose.

Some specific observations can be made concerning this extensive and free iPad initiative, which were also provided to academic staff. In the first
place it recognises that, with digital technology revolutionising how students interact with the world, then it makes sense for technology to be used in an educational context. The second aspect is the realisation that it makes sense that mobile technologies will assist students to engage with an ever-increasing online world. The third aspect is that there is no other consideration than issuing iPads to students. There was no consideration given to providing students with a laptop. This would seem to link in with the desire for students to be able to access relevant apps as part of their iPad. The fourth aspect is that the UWS iPad initiative enables students to access University materials via Wi-Fi at any time of the day. This means that the iPads issued do not have network access but rely on Wi-Fi for connectivity to the Internet for students. The fifth aspect is that the iPad initiative is directed to first year students only. This means that second or third year students were not provided with an iPad.

It should also be noted that UWS has Wi-Fi connectivity on all six campuses and this enables students to access the Internet and UWS intranet. On that basis all first year students are able to use their iPads to access educational material on campus. However those students are only able to access the Internet off campus if Wi-Fi connectivity is available where they are when they want to access their educational material.

The only other limiting aspect relates to the fact that non-first-year students were not provided with an iPad. In general this would not cause any issue as students in first year would not be in classes with second and third year students. However it may cause a problem for those staff who are teaching first year classes and also either a second or third year class. It may need adjustment on behalf of the teacher in terms of in-class activities where those students do not have iPads or have different technological devices. This aspect will be discussed in more detail in the following section.

**Teaching to First Year Law Students with iPads and Later Year Law Students Without iPads**

**First Year Law Students**

It will be noted that the iPad initiative at UWS (Western Sydney) was specifically designed to assist first year students only. This means that academic staff teaching first year students will be designing learning and teaching activities around the use of iPad applications and utilising such applications within the classroom, as Wi-Fi is available within those classrooms. This then raises the question of which applications can be
used as not all applications are free. A decision has to be made by the academic staff member as to whether it is appropriate to request students to download apps that are a cost to the student, or just restrict the learning and teaching to those apps that can be downloaded for free. This raises an equity issue that needs to be addressed at a university level.

The UWS initiative encouraged the use of iPads and relevant apps, plus Internet access for learning purposes. However iPads are not generally receptive to note-taking and recent research indicates that students do tend to stop using their iPads after a few weeks, due to the difficulty of taking notes (Fischman & Keller, 2011). There is the Evernote app which allows students to take notes but is not as user friendly as being able to type via a laptop. This was also a factor in the UWS initiative where first year students were trying to come to grips with the university environment, coping with a different learning environment, and specifically using iPad technology for learning. First year students to university have in fact been use to technology, but it may be more in the form of laptops rather than iPad tablet technology, and this may be a factor in being able to utilise the technology for learning and teaching purposes. Some studies have also confirmed that the trials of iPads at Stanford and University of Notre Dame were not successful as many students were uncomfortable with the technology and were more use to traditional technologies such as laptops (Weider, 2011).

This was also the experience in relation to the iPad initiative for first year law students at UWS. Students were happy to receive an iPad and realised that the iPad was going to be used in the classroom as an integral element of their learning. Academic staffs teaching were also committed to the use of the iPad for teaching purposes and this was set out clearly in the respective learning guides for each law unit. The learning interactive exercises included accessing, downloading, and using relevant legal apps by the students to solve preset problems. One particular app used was the AustLii app, which provides students access to Australian legislation and court decisions. Another very useful app for law students was the AGLC ref app, which provided students with access to the proper referencing for assignments and research papers. This material provides opportunities for both academic staff and students to engage with introductory legal topics and concepts. The problem encountered, though, related, not to the availability of very useful legal information, but to the fact that students wanted to engage with the teacher and take relevant notes to complement their knowledge base. This was not that easy to do with the iPad. This led to students actually using other mobile devices, such as laptops, to
accommodate this learning need. The end result was some students bringing their laptops instead of their iPad to class.

The use of mobile devices within the classroom provided an excellent opportunity for the storytelling pedagogy to be introduced to first year law students. Students are able to use free apps such as Explain Everything, create their own story about their experiences with the law, and share such stories with their classmates. The access to the Internet and thus access to unlimited material enabled students to investigate the background of the cases and present their findings to the remainder of the class. Students can use either the app Bamboo paper or iMovie to create a review of their investigatory process, describe to their classmates how the litigation between the parties arose, and describe the human emotions and attitudes of each of the relevant parties. Students could share their findings with their classmates by loading such findings on the shared UWS intranet. The only requirement was access to Wi-Fi, which at UWS is throughout all classrooms. In short first year students were able to come to grips with the human aspect relating to the story behind the litigating parties, which enabled students to understand how the law operates in a practical manner.

Second and Third Year Law Students

As iPads were only issued to first year students, second and third year law students either had to bring their own devices or not have a device at all. This did make it challenging for both student and academic staff member. Interactive classroom activities were potentially affected unless the teacher was well prepared and structured appropriate classroom activities. In short if the teacher set out the relevant requirements for the upcoming class, then students were in a good position to be able to come to class and access any online material that was being utilised. The difference though was that with second and third year students, the teacher needed to ensure that online educational activities were designed so as to accommodate the various devices that students would bring to class—be it a laptop, smartphone, or even an iPad.

Any mobile device used by second or third year law students provided an ideal opportunity to enhance the storytelling methodology by the academic teacher. Students have already been exposed to reported cases and the legislative processes in the first year, so the opportunity arises in the later years to build upon the storytelling methodology. The storytelling method only requires students to have access to the Internet, via Wi-Fi connectivity, and this was readily available for students in UWS classrooms. So on that basis there was no need for students to actually
have an iPad, but only required them to have access to a mobile device. In doing so there was no need to access any specific applications, but instead the opportunity arose to advance engaged active learning. For example, the use of the flipped classroom approach allowed students to use technology and the Internet to engage in learning experiences, with students then applying that learning in the classroom.

The end result of this teaching experience was that the availability of a mobile device, with Wi-Fi connectivity, was the key to structuring appropriate online activities for instructional design. Students needed to be aware of the potential of the use of mobile devices for educational purposes but they also need to be guided by their teachers as to how the mobile devices were to be utilised within the classroom. If students only had access to iPads, then the teacher would need to be selective with what apps were to be used and how this was linked to the content for the particular unit of study. If students had other mobile devices, then the educational activities could be structured around how to use such devices and that might also involve facilitating note-taking. For those teachers wishing to investigate and apply the storytelling methodology, then it did not matter which mobile device was being used, as long as access to the Internet was available.

The storytelling pedagogy is only dependent on having a technological device and access to the Internet, either within or outside the classroom. It makes no difference which particular technological device is being used by the student. The underlying rationale for the pedagogy rests in students actively investigating the background of a case and then formulating that for presentation to the class. The interaction between technology and the learning methodology of storytelling is very flexible. Students are used to life with technology, so the move by universities to utilise technology in an educational sense fits in perfectly with the concept of storytelling from student stories, teacher war stories, and stories of the litigating parties behind the cases.

2016 Student Device Initiative at Western Sydney University

In 2016 Western Sydney University has taken the approach that technological devices are central to the learning and teaching for students.
Deputy Vice Chancellor Denise Kirkpatrick has noted in a statement on 8 January 2016:\(^3\):

Several years ago Western Sydney University became one of the first universities to provide devices (iPads) to students as part of its flexible learning program. The 2016 program takes that a step further as the University works with industry leading technology partners such as Microsoft, to determine the most suitable device for each of our courses.

The 2016 program revolves around the Student Device Initiative whereby a new device (either an iPad, Tablet, or Windows Laptop) will be provided to all new commencing undergraduate students based on the course they are undertaking in 2016. The mobile technology will enable students to engage with the growing number of online services, which will include online lectures, live web streaming of lectures, apps and other tools which aim to provide the best possible learning and university experience.

In the case of the Law course, students are receiving iPads in 2016, so there is no change from the previous arrangement. As a comparison students enrolled in a Business course are now receiving laptops. Again the device strategy is only for first year students and students are unable to choose which device they wish to receive. The decision as to which device to provide to students was made by each school, in conjunction with the relevant academic staff. As has been discussed earlier the approach taken in the storytelling methodology for law students, there is no difference as to which device a student has to bring to class, so this provides a rationale for maintaining the iPad strategy.

**Discussion and Conclusion**

The iPad initiative in 2013 was a bold move by Western Sydney University. The underlying focus was to link a technological device, an iPad, with relevant educational apps for both learning and teaching purposes. The general consensus from students was that this was a positive approach and that it did motivate students. Of course it is clear that having an iPad in class with Wi-Fi access to the Internet could be viewed as a distraction to students as it was easy for them to then log onto their social media sites. Academic staff needed to be aware of this issue and ensure that relevant in-class activities kept law students active. Again the

storytelling methodology facilitated law students being active throughout the class. A structured series of online activities keep law students busy locating information on the Internet, using relevant apps to collate and then present their findings.

The move in 2016 by Western Sydney University to widen the provision of a device for students to include other technological devices acknowledges that different disciplines may need different approaches to be taken for their learning and teaching. It also illustrates that there is a need to work with the relevant hardware providers and build a relationship. For example, with those receiving the Microsoft Surface 3 device, there is recognition that Microsoft will support the implementation of the program and enhance educational uses so as to allow students to create, collaborate, and analyse problems as the device functions as full personal computer.

There is one aspect that needs a word of caution. It relates to law teachers who have to also implement the learning and teaching strategy. Most law teachers have been using the lecture method, problem-based questions, and case studies to teach the law for many years. With the advent of technology it does not mean that there is an easy transformation to an online and interactive teaching methodology. Support needs to be given to such teachers to ensure that they are also able to move with confidence into this brave new world of learning and teaching in higher education. With that support, the future for both student and teacher in legal education looks promising.
