Making deployments easy with Project Nebula

Kenaz (KAY-NUS) Kwa, Puppet
How do orchestrate your serverless deployments?
Delivering software faster is hard

Deploying cloud native applications and infrastructure at scale requires change in tools, process, and culture.

- Balancing freedom of choice with creating standards
- Lack of skills and experience in cloud-native world
- High TCO of maintaining a product
Project Nebula (beta)

A solution to **continuously deploy** applications and infrastructure:

- Simple deployment workflows built on using existing tools
- Support for multiple deployment targets, including serverless platforms
- Includes canary, B/G deployments & rollback
- Built upon Tekton! ([https://tekton.dev](https://tekton.dev))
