A handout of key concepts so you do not need to take as many notes.

Illustrations and additional material to make these ideas clear are given in the lecture. In this handout we only summarize key points.

1. Secondary Progressions are also known as Day-For-A-Year Progressions. The formula is simple: one day after birth is lived out as a year of life.

We have an internal biological clock that evolves and develops over one year for each day after we are born. This idea is made clear by seeing how it appears in an ephemeris.

2. The idea is simple: One day after birth = One year of life. However, we ignore this rule this rule for progressed houses. Houses are an exception to the simple rule. We progress planets by the formula 1 day = 1 year of life but we do not progress houses this way!

We see how this works in the chart of a famous person.

3. Why is there an exception to the rule for houses? Answer: because we want houses to move about 1 degree in a year of life. I give an example of why this is desirable. Unfortunately, progressed houses move 361 degrees in a year and not 1 degree. We don’t like this so we use various tricks and
gimmicks to force the houses to move 1 degree in a year!

4. Is there a way to preserve the simple formula:

\[ \text{ONE DAY} = 1 \text{ YEAR OF LIFE} \]

and still have progressed houses move about 1 degree per year?

**Yes! We do this by introducing the idea of fractal progressions.**

We simply repeat the formula A Day = A Year. It is like this

A Day = A Year (but this year is a day. We just said it is! : ) )

So we have:

A Day = A Year repeated two times.

This is explained in more detail in the lecture. The result is that about 4 minutes after birth = 1 year.

5. The popular Naibod in Solar Arc method produces similar results but is off by about 1 minute per year of life. We see in this lecture an example of this.

6. In the Middle Ages a technique of forecasting known as primary directions was used, and some astrologers use it today (which is different from circumambulations). **The fractal secondary chart may also be how primary directions should be calculated! Very elegant! This is a problem that Kepler, Regiomontanus and other great astrologers wrestled with.**

We see how the “Fractal Primary Chart” is beautifully synchronized with secondary progressed **fractal progressed houses**.

**Conclusion: We now have an elegant and beautiful system where the only rule is a day = a year, and the rule is fractal. This resolves the problem of how to progress houses AND also how to calculate primary directions!**
(This idea also has a basis in modern physics and is mentioned in the Bible).

7. **We see how these ideas work very nicely for the day that Marilyn Monroe died from a drug overdose.** This also rectifies her birth time which is on the half hour by 1 1/2 minutes, which is a reasonable possibility for a birth time given on the half hour.
